S

StudentOS

STUDENT PERFORMANCE SYSTEM

A PRACTICAL SCHOOL PLATFORM

Turn school activity into a clearer learner picture.

StudentOS brings school operations, assessment, learner evidence, review and family-facing updates into one role-aware workspace.

School leadership & implementation teams

School conversation edition | v1.0

Prepared 13 October 2026 | Product and workflow guide

THE OPPORTUNITY

One connected view of school progress

Schools often manage learner records, class activity, marks and communication across separate tools and spreadsheets.

The StudentOS promise

Give each role a focused place to do its work, while keeping information connected to the learner, class and school. Move from entry to review to family-visible publication with clear responsibility at each step.

WHAT SCHOOLS GAIN FROM A CONNECTED WORKFLOW

Less fragmentation

Keep learner, class, attendance and assessment context together rather than repeatedly rebuilding it across files.

Clearer accountability

Role-based workspaces separate school administration, teacher tasks, review and parent visibility.

More useful conversations

Bring scores and competency-linked evidence into a reviewable progress story for staff and families.

DESIGNED AROUND SCHOOL ROLES

Role	Primary focus
School administrator	Set up people, classes, subjects, assignments and school operations; review and publish evidence.
Teacher	Work with assigned classes, record attendance, create assigned-class assessments, and capture or submit evidence.
Parent / guardian	View linked learner updates after school publication; drafts and review-stage evidence stay private.
Student	Learner-account access is supported where the school chooses to link a student profile.

THE PLATFORM

A school workspace, not just a marks sheet

StudentOS combines day-to-day administration with two complementary assessment approaches.

School setup > Class activity > Assessment > Review > Family update

School operations

Student and user records, classes, teacher assignments, attendance, timetable and fee structures.

Traditional assessments

Create quizzes, assignments, mid-term/final exams or projects; record marks against a maximum score.

CBC assessment plans

Create curriculum-oriented checkpoints with components, optional rubrics or grade scales, and learner evidence.

Review and publication

School staff can review submitted evidence and publish results for parent-facing learning updates.

Reports and exports

Generate individual/class PDF reports and download available school data exports.

Insights

View configured performance analysis and trends; AI-assisted analysis depends on service configuration and data quality.

Two assessment paths, one learner record

Use traditional score assessments for familiar tests and mark entry. Use CBC assessment plans when the school wants to connect evidence to curriculum outcomes, rubric levels and moderation.

EVERYDAY VALUE

A useful day for each role

The platform is most valuable when each person can complete the next school task without stepping outside their permissions.

Administrator

- Prepare academic years, periods, classes and subjects.
- Create accounts and map teachers to classes/subjects.
- Monitor attendance, fees, assessment activity and reports.
- Review moderation items and publish evidence.

Teacher

- Open assigned classes and mark attendance.
- Create an assessment for an assigned class and subject.
- Record marks or capture CBC-linked evidence.
- Submit evidence for school review; respond to returned work.

Parent / guardian

- Use the account linked by the school.
- Review published learner updates and school-shared reports.
- Contact the school when a learner is not linked or updates are absent.

Who controls what?

Administrators create subjects, classes, users and school-wide settings. Teachers work only with assigned classes and subjects. Parents see published information for linked learners, not drafts.

WHY STUDENTOS

Built for practical implementation

A useful platform depends on setup, permissions and staff habits as much as it depends on software.

1. **Map your current process**
   Identify who maintains records, enters marks, takes attendance, approves reports and communicates with families.

2. **Prepare the school structure**
   Confirm academic year and periods, class names, subject list, staff, learner roster and teacher assignments.

3. **Choose an assessment pilot**
   Start with one grade, a few classes or one reporting period. Decide whether the pilot uses score assessments, CBC plans, or both.

4. **Train by role**
   Train administrators on setup/review, teachers on attendance and assessments, and parents on linked published updates.

5. **Review and expand**
   Check data quality, access, completion and staff feedback before extending the workflow across the school.

Recommended pilot

Use a small cohort and a real reporting cycle. Agree in advance on the class/subject assignments, who reviews submissions, and what counts as ready to publish.

IMPLEMENTATION SUCCESS IS SHARED

The school supplies accurate roster and curriculum information and assigns workflow owners. The implementation team helps configure, test and train. Confirm support scope, service levels and pricing directly with the provider before contracting.

A GUIDED DEMONSTRATION

Show the workflow in 12 minutes

A simple demonstration should follow a school task, not a tour of every menu.

Time	Demo moment	What to show
0-2 min	**Start with the school**	Show the school-scoped dashboard and clarify the administrator's setup role.
2-4 min	**Show a class**	Open a teacher's assigned class and demonstrate the attendance roster.
4-7 min	**Create a checkpoint**	Create a traditional assessment for an assigned class/subject, then show where scores are recorded.
7-9 min	**Show CBC evidence**	Open the assessment-plan workspace and explain outcomes, evidence, rubric/scale options and draft/open status.
9-11 min	**Review before sharing**	Show the moderation queue and explain that parents see published evidence, not drafts.
11-12 min	**Close with fit**	Ask the school which grade, subject and reporting cycle should be used for a pilot.

Discovery questions

Which part of the school's current process is hardest to coordinate? Who approves results? How are CBC observations recorded today? Which systems or templates must remain in use? What would make a first-term pilot worthwhile?

FIT AND READINESS

Questions to ask before a pilot

Use these prompts to uncover workflow fit, data readiness and decision ownership.

PEOPLE & PROCESS

- Who creates learners, classes, subjects and user accounts?
- Which teachers are assigned to which classes and subjects?
- Who reviews, returns or publishes assessment evidence?
- How do parents currently receive reports and feedback?

DATA & CURRICULUM

- What learner roster fields and admission-number rules are used?
- Which grade/class naming conventions should imports follow?
- Is the school using traditional marks, CBC evidence plans, or both?
- Which curriculum version, outcomes, rubrics and grade scales are configured?

OPERATIONS & ADOPTION

- Which devices and connectivity are available to staff?
- What is the smallest useful pilot cohort?
- What training and support window does the school require?
- What data should be migrated, and who approves its accuracy?

Set expectations clearly

Confirm current integrations, curriculum content, support arrangements, hosting, privacy terms and commercial terms before making commitments. Do not promise automated outcomes or integrations unless they are verified for that school.

HONEST PRODUCT BOUNDARIES

What to confirm in a school meeting

This overview describes the product workflows verified in the application as of 13 October 2026. Availability depends on school configuration and deployment settings.

Available workflows

Role-based sign-in; school records; classes and subjects; teacher assignments; attendance; score-based assessments; CBC assessment plans and evidence; moderation and publication; parent learning updates; PDF/Excel reporting; bulk import.

Depends on configuration

Curriculum tree depth and learning outcomes; rubric and grade-scale options; email or notification delivery; optional AI-assisted analysis; imported learner history and school-specific report setup.

Do not promise without verification

A specific M-Pesa, SMS, SIS or LMS integration; offline synchronization; any regulatory certification; a service-level guarantee; quantified learning gains; fixed pricing or implementation timelines.

Before sharing externally

Replace the contact line on the cover with an approved contact. Confirm the deployed product URL, current feature configuration, privacy notice, data-processing terms and commercial offer with the product owner.
